

Metal Industry Indicators

Indicators of Domestic Primary Metals, Steel, Aluminum, and Copper Activity

August 1999

The primary metals leading index was unchanged in July, but its 6-month smoothed growth rate continues to point to moderate growth in U.S. metals activity. The growth rates of the other metal industry leading indexes are also solidly in the range that signals increased near-term growth. The trend of the metals price leading index has been flat since April, while growth in inventories of U.S. nonferrous metal products is declining. This suggests no more than modest growth, if any, for most metal prices in the coming months.

The July **primary metals leading index** was unchanged from June's revised level of 128.9, and the index's 6-month smoothed growth rate, a compound annual rate that measures the near-term trend, slowed to 3.6% from 3.9% in June. A growth rate above +1.0% is usually a sign of an upward near-term trend, while a growth rate below -1.0% usually signals a downward trend.

Only four of the index's eight components were available for the July index calculation, therefore the leading index is preliminary and will likely be revised next month when the other indicators are added. Declines in the Purchasing Managers' Index and the S&P stock price index for diversified machinery companies were offset by increases in the average workweek in primary metals establishments and the growth rate of the Journal of Commerce metals price index. Although the primary metals leading index has been flat for the past 2 months, its growth rate continues to point to moderate growth in domestic primary metals activity in the next few months.

The **steel leading index** increased 0.4% in June, the latest month for which it is available, to 112.9 from 112.5 in May. The index's 6-month smoothed growth rate rose to 5.8%, its highest rate since November 1997. Six of the index's nine components increased in June. However, these increases were partly offset by a 10-percent drop in the S&P stock price index for steel companies. The high growth rate of the steel leading index is pointing to a pickup in growth in U.S. steel activity in the coming months.

The **aluminum mill products leading index** rose 0.6% in June to 158.6 from 157.6 in May, and the index's 6-month smoothed growth rate climbed to 4.9%, its highest growth rate in 16 months. Three components, the Purchasing Managers' Index, the index of U.S. housing permits, and the industrial production index for automotive products, accounted for most of the net increase in the leading index. The growth rate of the leading index has generally been rising since the end of last year and continues to point to higher growth in U.S. aluminum mill products activity, which could begin early next year.

The **primary aluminum leading index** increased 0.6% in June to 90.6 from 90.1 in May. The index's 6-month smoothed growth rate climbed to 4.8% in June, which marks the highest growth rate for this index since January 1995. The largest positive contributions to the net change in the leading index came from the length of the average workweek in primary aluminum establishments, which increased to its highest level in a year, and the ratio of shipments to inventories for motor vehicles and parts. The primary aluminum leading index has been rising slowly since last December, and five of its seven components have increased over that period. The leading index is pointing to higher demand for primary aluminum in the near future. (Tables and charts for the primary aluminum indexes are in a separate file.)

Driven by a large gain in the LME spot price of copper, the **copper leading index** advanced 1.0% in June to 131.7 from a revised 130.4 in May. The index's 6-month smoothed growth rate also moved up sharply to 3.9% from a revised 2.3% in May. The growth rate of the copper leading index has been above +1.0% seven of the past eight months and continues to signal increased demand for copper. During this time, copper mining and processing in the United States have fallen because of low prices and high inventories resulting in part from the decline in the Southeast Asian economies. Any increased future demand for copper may not immediately affect the domestic copper industry since demand can be met from current inventory levels. The average lead of the copper leading index is 8 months. If the copper leading index is signaling a strong increase in domestic activity, copper activity could begin to grow consistently early next year.

Little Change in Leading Index of Metal Prices and U.S. Metal Products Inventories

The metals price leading index was unchanged in June at 97.4, the same as May's revised level, and its 6-month smoothed growth rate slowed slightly to -0.3% from a revised -0.1% in

May. Of the four indicators that make up the index, the strongest negative impact came from the growth rate of the inflation-adjusted value of U.S. M2 money supply. The growth rates of the inflation-adjusted value of new orders for U.S. nonferrous and other primary metals and the OECD total leading index also moved down slightly. However, these declines were partly offset by an increase in the growth rate of building permits for new U.S. housing units.

The 6-month smoothed growth rate of the inflation-adjusted value of U.S. nonferrous metal products inventories, an indicator of metals supply, moved to -1.5% in June from a revised -3.2% in May. This is the second consecutive negative growth rate, a sign that the trend in inventory growth is pointing downward. However, metal inventories still remain at relatively high levels, and even though demand for metals is picking up, it may not be strong enough to push inventory levels significantly lower.

The leading index of metal prices and the growth rate of metal inventories suggest the possibility of only modest increases in some metal prices in the near term.

Table 1.
Leading Index of Metal Prices and Growth Rates of the Nonferrous Metals Price Index, Inventories of Nonferrous Metal Products, and Selected Metal Prices

Six-Month Smoothed Growth Rates						
	Leading Index of Metal Prices (1967=100)	MII Nonferrous Metals Price Index	U.S. Nonferrous Metal Products Inventories (1982\$)	Primary Aluminum	Primary Copper	Steel Scrap

July	NA	13.5	NA	15.8	11.4	4.4

NA: Not available **r:** Revised

Note: The components of the Leading Index of Metal Prices are the 6-month smoothed growth rates of the following: 1, the deflated value of new orders for nonferrous metals; 2, the OECD leading index, total; 3, the index of new private housing units authorized; and 4, the deflated value of U.S. M2 money supply. The Metal Industry Indicators (MII) Nonferrous Metals Price Index measures changes in end-of-the-month prices for primary aluminum, copper, lead, and zinc traded on the London Metal Exchange (LME). The steel scrap price used is the price of No. 1 heavy melting. Inventories consist of the deflated value of finished goods, work in progress, and raw materials for U.S.-produced nonferrous metals and nonferrous metal products. Six-month smoothed growth rates are based on the ratio of the current month's index or price to its average over the preceding 12 months, expressed at a compound annual rate.

CHART 9.
COPPER: LEADING AND COINCIDENT GROWTH RATES, 1978-99

Percent

Shaded areas are business cycle recessions.

The growth rates are expressed as compound annual rates based on the ratio of the current month's index to its average level during the preceding 12 months.

Explanation

Each month, the U.S. Geological Survey tracks the effects of the business cycle on five U.S. metal industries by calculating and publishing composite indexes of leading and coincident indicators. Wesley Mitchell and Arthur Burns originated the cyclical-indicators approach for the economy as a whole at the National Bureau of Economic Research in the mid-1930's. Over subsequent decades this approach was developed and refined, mostly at the National Bureau, under the leadership of Geoffrey H. Moore.¹

A business cycle can briefly be described as growth in the level of economic activity followed by a decline succeeded by further growth. These alternating periods of growth and decline do not occur at regular intervals. Composite indexes, however, can help determine when highs and lows in the cycle might occur. A composite index combines cyclical indicators of diverse economic activity into one index, giving decision makers and economists a single measure of how changes in the business cycle are affecting economic activity.

The indicators in the metal industry leading indexes historically give signals several months in advance of major changes in a coincident index, a measure of current metal industry activity. Indicators that make up the leading indexes are, for the most part, measures of anticipations or new commitments to various economic activities that can affect the metal industries in the months ahead.

Composite coincident indexes for the metal industries consist of indicators for production, shipments, and total employee hours worked. As such, the coincident indexes can be regarded as measures of the economic health of the metal industries.

Four of the metal industry coincident indexes, those for primary metals, steel, primary aluminum, and aluminum mill products, reflect their classifications in the U.S. Standard Industrial Classification (SIC). The SIC is the main classification used by the United States government and industry in collecting and tabulating economic statistics. The coincident index for copper is a blend of two different copper industries, primary smelting and refining of copper and rolling, drawing, and extruding of copper.

Of the five metal industries, primary metals is the broadest, consisting of twenty-six different metal processing industries. The steel, aluminum, and copper industries are parts of the primary metals industry.

The metal industry leading indexes turn before their respective coincident indexes an average of 9 months for primary metals and 8 months for steel and copper. The average lead time for the primary aluminum leading index is 6 to 8 months, and the

average lead time for the aluminum mill products leading index is 6 months.

The leading index of metal prices, also published in the *Metal Industry Indicators*, is designed to signal changes in a composite index of prices for primary aluminum, copper, lead, and zinc traded on the London Metal Exchange. On average, this leading index indicates significant changes in price growth about 7 months in advance.

The growth rate used in the *Metal Industry Indicators* is a 6-month smoothed growth rate at a compound annual rate, calculated from a moving average. Moving averages smooth fluctuations in data over time so that trends can be observed. The 6-month smoothed growth rate is based upon the ratio of the latest monthly value to the preceding 12-month moving average.

$$\left[\left(\frac{\text{current value}}{\text{preceding 12-month moving average}} \right)^{\frac{12}{6.5}} - 1.0 \right] * 100$$

Because the interval between midpoints of the current month and the preceding 12 months is 6.5 months, the ratio is raised to the 12/6.5 power to derive a compound annual rate.

The growth rates measure the near-term industry trends. They, along with other information about the metal industries and the world economy, are the main tools used to determine the outlook of the industries. A 6-month smoothed growth rate above +1.0% usually means increasing growth; a rate below -1.0% usually means declining growth.

The next summary is scheduled for release on MINES FaxBack at 10:00 a.m. EDT, Friday, September 17. Access MINES FaxBack from a touch-tone telephone attached to a fax machine by dialing 703-648-4999. The address for *Metal Industry Indicators* on the World Wide Web is: <http://minerals.usgs.gov/minerals/pubs/mii/>

The *Metal Industry Indicators* is produced at the U.S. Geological Survey by the Minerals Information Team. The report is prepared by Kenneth Beckman (703-648-4916), e-mail (kbeckman@usgs.gov), and Gail James (703-648-4915), e-mail (gjames@usgs.gov). The Center for International Business Cycle Research, under the direction of Dr. Geoffrey H. Moore, and the former U.S. Bureau of Mines developed the metal industry leading and coincident indexes in the early 1990's. Customers can send mail concerning the *Metal Industry Indicators* to the following address:
